EXPERIENCE

Ambak Home Loans

May 2026 – Present

Product Intern

Gurugram, Haryana

- Conducted primary research with **30–40 Relationship Managers** to diagnose why 2,500+ registered partners weren't independently using Ambak Saathi, uncovering that partners were submitting leads via RMs and processing loans through existing bank tie-ups, bypassing the app entirely.
- Built **CleverTap feature adoption funnels** for 4 core app features (CIBIL Score, APF, Banker's Directory, My Earnings), establishing the first baseline activation metrics and revealing sub-20% adoption on the flagship CIBIL feature.
- Defined requirements for a **Partner Activation CRM** integrated into Ambak Sangam, giving the onboarding team real-time visibility into partner activation status, retention health (Active / At Risk / Dormant / Churned), and recommended next action per partner.
- **Eliminated the engineering dependency for partner communications** by migrating campaign triggers out of the backend into CleverTap, enabling the business team to build and launch campaigns self-serve without an engineering release.
- Automated the workflows of the Partner Experience and Pre-Sales (PST) operations teams, **reducing their manual effort by 70%**.
- Audited CleverTap event mapping across Ambak Saathi and proposed corrected event nomenclature to improve analytics data reliability for product decisions.

PolicyBazaar for Business

Dec 2025 – May 2026

Product Intern · Nautica Sales Insight Generation Platform (Employee Benefits)

Gurugram, Haryana

- Identified a critical information gap in the enterprise renewal sales process — reps had zero visibility into client claims history — and **defined product requirements for Nautica**, a Sales Insight Platform built on AWS QuickSight.
- Defined dashboard scope covering Incurred Claim Ratios, Loss Ratios, projected renewal premiums, and client risk profiles, giving the sales team a data-backed foundation for renewal negotiations for the first time.
- Defined **logic to segment recurring vs. non-recurring medical claims**, ensuring risk scores reflected ongoing client risk rather than one-time event distortion, improving risk-assessment accuracy by an estimated 15%.
- Reduced manual reporting effort by **~30%** through automated QuickSight dashboards and delivered 20+ ad-hoc leadership analyses, accelerating data-driven decision-making across the Employee Benefits strategy team.
- Acted as the cross-functional connector between sales, strategy, and data/tech teams, translating business needs into data requirements and surfacing insights in sales-ready language.

PROJECTS

ISL Vision: Real-Time Indian Sign Language Recognition using Video Transformers | github.com/dhairya1411/ISL_Visions

- **Fine-tuned VideoMAE (Vision Transformer)** on a 262-class Indian Sign Language dataset, achieving 91.45% Top-1 accuracy and outperforming prior CNN-LSTM models by ~25 percentage points using transfer learning on Kaggle GPUs.
- Built a real-time sign language translator: records a 1.5-second gesture via webcam, runs transformer inference in a background thread, and displays the predicted sign with confidence score on CPU hardware.
- Tech Stack: Python, PyTorch, HuggingFace Transformers, OpenCV, CustomTkinter

PolicyLens: AI Health Insurance Claim-Readiness Checker | github.com/dhairya1411/Policylens | policylens-nine.vercel.app

- **Shipped an AI product** that reads a health insurance policy PDF and returns whether a described claim is likely covered, with every statement citing the exact clause and page from the user's own document.
- Defined **dangerous-error rate** — asserting coverage the policy excludes — as the north-star quality metric, and built a 24-scenario eval suite that fails the build if a single dangerous error appears.
- Raised eval pass rate from 79.2% to **91.7% with 0 dangerous errors** by restructuring the prompt into five sequential decision gates after the suite caught a self-introduced regression.
- Tech Stack: Next.js, Llama 3.3 (Groq), RAG with clause-level citations, automated evals

Retail Customer Behavior Analytics | github.com/dhairya1411/Customer-Behavior-Analysis

- **Analyzed 3,900 retail transaction records** (\$233K revenue) using Python and PostgreSQL, identifying male customers generating 2.1x more revenue and flagging 839 above-average spenders who consistently purchase on discount as a margin-recovery segment.
- Authored Power BI dashboards and delivered strategic recommendations, including a targeted loyalty program aimed at converting 701 returning buyers into subscribers.
- Tech Stack: Python, Pandas, NumPy, SQL, Power BI

SKILLS

Programming: Python, SQL
Data & Analytics: Power BI, AWS QuickSight, AWS Athena, MySQL, Microsoft Excel, Google Sheets
Product & Growth Tools: CleverTap, Serri.ai, WhatsApp Business API, Ambak Sangam (CRM), Postman, Figma
Product: Product Discovery, Product Strategy, Roadmap Planning, User Research, Funnel Analysis, A/B Testing, Prototyping, Feature Prioritization, API Testing, CRM Design, AI Evaluation Design, Stakeholder Management
Soft Skills: Data Storytelling, Analytical Problem Solving, Cross-functional Collaboration, Communication

EDUCATION

B.Tech, Computer Science & Engineering	September 2022 – May 2026
<i>Amity University, Lucknow</i>	CGPA: 8.01

ACHIEVEMENTS

Google Cloud Computing Foundations, NPTEL	August – October 2024
• Elite + Silver Medal • Ranked in Top 2% (Score: 85/100) • Completed 8-week course on GCP services including Compute, Storage, Networking, Big Data and Machine Learning.
